

NexusHR AI - Management Summary

Purpose

NexusHR AI is an internal HR automation system being developed to reduce manual recruitment work and improve hiring coordination. It is not a client product and is not intended for sale.

The system supports HR with candidate intake, CV screening, candidate archiving to Drive/Sheets, shortlisting, and future candidate communication and interview scheduling.

Before The System

- Candidate data was handled manually across emails, files, spreadsheets, and job portals.
- HR had to review CVs one by one and manually compare them with job requirements.
- Candidate records were not consistently moved automatically to Drive and Sheets.
- Follow-up messages, candidate confirmation, and interview scheduling required manual effort.
- Reporting and tracking depended on manual updates.

After The System

- Candidate records are centralized in one system.
- CVs can be processed and scored with AI assistance.
- All candidate records can be archived to Drive and Sheets for future use.
- HR gets better visibility into candidate status and automation progress.
- Future phases will support automated outreach, readiness confirmation, and interview scheduling.

Current Status

Already implemented:

- Admin login
- Job and candidate management
- Gmail CV intake
- PDF parsing
- AI-assisted candidate analysis
- Shortlist/review/reject status
- Google Drive upload service for candidate records
- Google Sheets logging service for candidate records
- HR AI Agent dashboard

Recently improved:

- Login/UI visibility issue fixed
- Frontend styling configuration corrected
- Candidate export reporting made more accurate
- Sheets logging now updates existing candidate rows instead of creating duplicates
- Backend and frontend TypeScript checks passed
- Frontend and backend health checks verified

Key Benefits

- Reduces repetitive HR effort
- Improves candidate tracking
- Makes candidate tracking more consistent
- Reduces missed records, missed follow-ups, and manual handoff errors
- Helps HR scale recruitment activity without proportional manual workload

Next Phase

Recommended next priorities:

1. Stabilize UI/UX across Login, Recruitment, and HR AI Agent screens.
2. Harden all-candidate export to Drive and Sheets with clear success/failure status.
3. Import and normalize the internal candidate database.
4. Build structured matching for salary, experience, skills, role, and location.
5. Add email outreach first, then WhatsApp/SMS later.
6. Add interview scheduling after candidate readiness confirmation.

Final Note

NexusHR AI has a working foundation, but it is not yet a fully autonomous recruitment platform. The correct approach is to continue in focused phases, prioritizing reliability and HR workflow value before expanding features.
